

Uber Ride Booking Analysis Dashboard

Project Synopsis | Objective, Key Insights & Recommendations

1. Objective

- To analyse Uber ride booking data using Microsoft Excel.
- To understand booking patterns, vehicle demand, revenue and cancellation behaviour.
- To analyse booking performance across different vehicle types and pickup locations.
- To study ride distance and driver/customer rating patterns.
- To identify important trends and operational issues from the booking data.
- To create an interactive dashboard using PivotTables, PivotCharts, slicers and a timeline.
- To present the analysed information in a simple and understandable visual format.

2. Key Insights

- A total of 150,000 Uber booking records were analysed.
- 93,000 bookings were completed, giving a completion rate of 62%.
- 27,000 bookings were cancelled by drivers, while 10,500 were cancelled by customers.
- 10,500 bookings had no driver found.
- The overall cancellation rate was 25%.
- Booking volume differs across vehicle types, showing different levels of demand.
- Revenue also varies across vehicle types based on the total Booking Value.
- Certain pickup locations have higher booking volumes than others.
- Average ride distance varies across different vehicle types.
- Driver and customer ratings show differences across vehicle categories.
- The dashboard allows these patterns to be explored interactively using slicers and the date timeline.

3. Recommendations

- Analyse the main reasons for driver cancellations and take suitable steps to reduce them.
- Improve driver availability in locations and time periods with high booking demand.
- Monitor high-volume pickup locations and improve driver allocation in those areas.
- Maintain sufficient availability of vehicle types that receive higher booking demand.
- Monitor incomplete rides and no-driver-found cases to identify operational gaps.
- Use driver and customer rating trends to identify areas for service-quality improvement.
- Regularly monitor booking, revenue and cancellation KPIs through the dashboard.
- Use the dashboard insights to support better operational planning and resource allocation.

These recommendations are derived directly from the booking, cancellation and performance patterns observed in the dashboard, and are intended to support data-driven decision-making for ride-hailing operations.
